8-bit transparent D-Type Latch with 3-State Outputs in bare die form

Rev 1.0  
07/02/19

## Description

The 74HCT373 consists of eight D-type transparent latches fabricated using a 2.5 $\mu$ m 5V CMOS process to combine high speed performance LSTTL performance with CMOS low power consumption. Each latch is equipped with separate D-Type inputs and 3-State outputs for bus oriented applications. Data output changes asynchronously and data may be latched even when the outputs are not enabled. Device inputs directly accept both standard CMOS and LSTTL outputs. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

## Absolute Maximum Ratings<sup>1</sup>

PARAMETER	SYMBOL	VALUE	UNIT
DC Supply Voltage (Referenced to GND)	V <sub>CC</sub>	-0.5 to +7.0	V

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. 2. Measured in plastic DIP package, results in die form are dependent on die attach and assembly method.

## Recommended Operating Conditions<sup>3</sup> (Voltages referenced to GND)

3. This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V<sub>IN</sub> and V<sub>OUT</sub> should be constrained to the range GND ≤ (V<sub>IN</sub> or V<sub>OUT</sub>) ≤ V<sub>CC</sub>. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V<sub>CC</sub>). Unused outputs must be left open.
