Linear Voltage Regulator – LM317A

Positive Adjustable 1.5A output Voltage Regulator in bare die form

Rev 1.0

Description

The LM317A is a wide V_{IN} adjustable 3-terminal voltage regulator with guaranteed 1.5A output current and equipped with internal limiting + thermal shutdown features for overload immunity. Output voltage is set by two external resistors. Additional to standard regulator function, the device can be used as a simple adjustable switching regulator; a programmable output regulator; or by connecting a fixed resistor between adjustment pin and output, can be used as a precision current regulator. A shutdown mechanism can be introduced by clamping the adjust terminal to ground which programs output to 1.2V where most loads draw little current.

Features:

- Output current in excess of 1.5A
- Adjustable output between 1.2V - 37V
- Internal short circuit current limit
- Internal thermal overload protection
- Output transistor Safe-Area Compensation
- Floating operation for high voltage applications
- 0.01% Line, 1% Load regulation maximum
- Negative Voltage complement is LM337

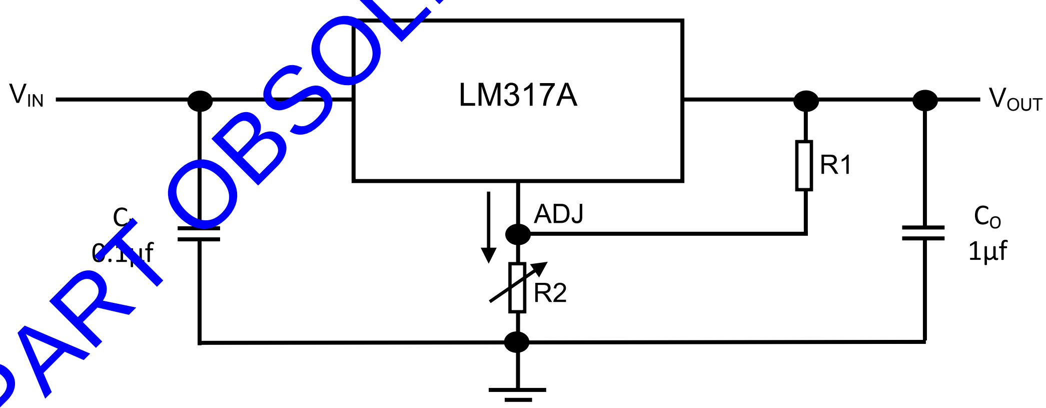
Typical Application



1.2V–25V Adjustable Regulator

$$V_{OUT} = 1.25V\left(1 + \frac{R2}{R1}\right) + I_{ADJ} * R2$$

I_{ADJ} tolerance <100µA

C_I is required if the regulator is located an appreciable distance from power supply filter. C_O is not required for stability; however it does improve transient response. For optimum stability and transient response locate C_I C_O as close as possible to the regulator.

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. **2.** Regulation is measured at a constant junction temperature, using pulse testing with a low duty cycle. Changes in output voltage due to heating effects are covered under the specifications for thermal regulation.
