Advanced CMOS Logic – 54AC14

Hex Schmitt-Trigger Inverter Logic IC in bare die form

Rev 1.0

Description

The 54AC14 Hex Schmitt-Trigger Inverter is fabricated using a 1.5µm 5V CMOS process with the same high speed performance of LSTTL combined with CMOS low power consumption. The device performs the Boolean function Y = Ā in positive logic. Device inputs are compatible with Standard CMOS outputs; with pull-up resistors, they are compatible with LSTTL outputs. Schmitt-Trigger inputs transform slow input rise and fall times into sharply defined jitter-free output signals. Due to the hysteresis voltage of the Schmitt trigger, the 54AC14 is useful in noisy environments.

Features:

- Outputs Sink/Source 24mA
- Low Input Current: 1µA
- Outputs directly interface CMOS, NMOS and TTL
- Operating Voltage Range: 2V to 6V
- CMOS High Noise Immunity
- Function compatible with 54HC14 or 54LS14
- Full Military Temperature Range.

Absolute Maximum Ratings[1]

PARAMETER	SYMBOL	VALUE	UNIT
DC Supply Voltage (Referenced to GND)	V_{CC}	-0.5 to +7.0	V
DC Input Voltage (Referenced to GND)	V_{IN}	-0.5 to V_{CC} +0.5	V
DC Output Voltage (Referenced to GND)	V_{OUT}	-0.5 to V_{CC} +0.5	V
DC Input Current	I_{IN}	±20	mA
DC Output Current, per pad	I_{OUT}	±50	mA
DC Supply Current, V_{CC} or GND, per pad	I_{CC}	±50	mA
Power Dissipation in Still Air[2]	P_D	750	mW

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. **2.** Measured in plastic DIP package, results in die form are dependent on die attach and assembly method.

3. This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range GND ≤ (V_{IN} or V_{OUT}) ≤ V_{CC}. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.
