Quad 2-Input NOR Gates in bare die form

Rev 1.0

Description

The 54HC02 2-Input NOR Gate is fabricated on a .35µm advanced CMOS process combining high speed LSTTL performance with CMOS low power. The device performs the Boolean function $Y = (A + B)$ or $Y = \bar{A} \cdot \bar{B}$ in positive logic. Internal circuitry comprises of three stages and includes buffered output for high noise immunity and stability. Inputs are compatible with standard CMOS outputs; with pull-up resistors, they are compatible with LSTTL outputs. The product die size is significantly smaller than industry peers due to its re-design and production using a more advanced CMOS process.

Features:

- Output Drive Capability: 10 LSTTL Loads
- Low Input Current: 1µA
- Outputs directly interface CMOS, NMOS and TTL
- Operating Voltage Range: 2V to 6V
- Function compatible with 54LS02
- High Noise Immunity CMOS process
- Full Military Temperature Range.

Absolute Maximum Ratings¹

PARAMETER	SYMBOL	VALUE	UNIT
DC Supply Voltage (Referenced to GND)	V_{CC}	-0.5 to +7.0	V
DC Input Voltage (Referenced to GND)	V_{IN}	-0.5 to $V_{CC} + 0.5$	V
DC Output Voltage (Referenced to GND)	V_{OUT}	-0.5 to $V_{CC} + 0.5$	V
DC Input Current	I_{IN}	± 20	mA
DC Output Current, per pad	I_{OUT}	± 25	mA

Storage Temperature Range	T_{STG}	-65 to 150	$^{\circ}C$

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. 2. Measured in plastic DIP package, results in die form are dependent on die attach and assembly method.

3. This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range $GND \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{CC}$. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.
