

High Speed CMOS Logic – 54HC4060

14-Stage Binary Ripple Counter / Divider with Oscillator in bare die form

Rev 1.0
26/11/17

Description

The 54HC4060 is produced on a 2.5µm 5V CMOS process with high speed LSTTL performance combined with CMOS low power consumption. The device consists of 14 master–slave flip–flops & an oscillator with frequency controlled either by crystal or by external RC circuit. Each flip–flop output feeds the next where each output frequency is half the preceding one. A high-to-low transition on the clock input increments the counter. The active–high Reset is asynchronous & disables the oscillator for low standby power consumption. Ten kinds of divided output are provided; 4 to 10 & 12 to 14 stage inclusive. Maximum division available at Q12 is 1/16384 of oscillator frequency.

Features:

- Output Drive Capability: 10 LSTTL Loads
- Low Input Current: 1µA
- Outputs directly interface CMOS, NMOS and TTL
- Operating Voltage Range: 2V to 6V
- CMOS High Noise Immunity
- Function compatible with CD4060B
- Full Military Temperature Range.

Ordering Information

The following part suffixes apply:

- No suffix - MIL-STD-883 /2010B Visual Inspection
- “H” - MIL-STD-883 /2010B Visual Inspection
+ MIL-PRF-38534 Class H LAT
- “K” - MIL-STD-883 /2010A Visual Inspection (Space)
+ MIL-PRF-38534 Class K LAT

LAT = Lot Acceptance Test.

For further information on LAT process flows see below.

Die Dimensions in µm (mils)

Supply Formats:

- Default – Die in Waffle Pack (100 per tray capacity)
- Sawn Wafer on Tape – On request
- Unsawn Wafer – On request
- Die Thickness <=> 350µm(14 Mils) – On request
- Assembled into Ceramic Package – On request

Mechanical Specification

Die Size (Unsawn)	1610 x 1610 63 x 63	µm mils
Minimum Bond Pad Size	110 x 110 4 x 4	µm mils
Die Thickness	350 (±20) 13.78 (±0.79)	µm mils
Top Metal Composition	Al 1%Si 1.1µm	
Back Metal Composition	N/A – Bare Si

Pad Descriptions

INPUTS

Osc IN (Pad 11)

Negative-edge triggering clock input. A high-to-low transition on this input advances the state of the counter. Osc IN may be driven by an external clock source.

CONTROL INPUTS

MR (Pad 12)

Active-high reset. A high level applied to this input asynchronously resets the counter to its zero state (forcing all Q outputs low) and disables the oscillator.

OUTPUTS

Q4—Q10, Q12—Q14 (Pads 7, 5, 4, 6, 13, 15, 1, 2, 3) Active-high outputs. Each Qn output divides the Clock input frequency by 2^N . The user should note the Q1, Q2, Q3 and Q11 are not available as outputs.

Osc OUT1, Osc OUT2 (Pads 9, 10)

Oscillator outputs. These pads are used in conjunction with Osc IN and the external components to form an oscillator. When Osc IN is being driven with an external clock source, Osc OUT1 and Osc OUT2 must be left open circuited. With the crystal oscillator in RC configuration, Osc OUT2 must be left open circuited.

Absolute Maximum Ratings¹

PARAMETER	SYMBOL	VALUE	UNIT
DC Supply Voltage (Referenced to GND)	V_{CC}	-0.5 to +7.0	V
DC Input Voltage (Referenced to GND)	V_{IN}	-0.5 to $V_{CC} + 0.5$	V
DC Output Voltage	V_{OUT}	-0.5 to $V_{CC} + 0.5$	V
DC Input Current, per pad	I_{IN}	±20	mA
DC Output Current, per pad	I_{OUT}	±25	mA
DC V_{CC} or GND Current, per pad	I_{CC}	±50	mA
Power Dissipation in Still Air ²	P_D	750	mW
Storage Temperature Range	T_{STG}	-65 to 150	°C

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. 2. Measured in plastic DIP package, results in die form are dependent on die attach and assembly method.

Recommended Operating Conditions³ (Voltages referenced to GND)

PARAMETER	SYMBOL	MIN	MAX	UNITS	
DC Supply Voltage	V_{CC}	2 ⁴	6	V	
DC Input or Output Voltage	V_{IN}, V_{OUT}	0	V_{CC}	V	
Operating Temperature Range	T_J	-55	+125	°C	
Input Rise or Fall Times	$V_{CC} = 2.0V$	t_r, t_f	0	1000	ns
	$V_{CC} = 4.5V$		0	500	
	$V_{CC} = 6.0V$		0	400	

3. This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range $GND \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{CC}$. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

4. The oscillator is guaranteed to function at 2.5 V minimum. However, parametrics are tested at 2.0V by driving Pad 11 with an external clock source.

		4.5V		39	49	61	
		6.0V		33	42	53	

6. Not production tested in die form, characterized by chip design and tested in package.

7. For T_J = 25°C and C_L = 50 pF, typical propagation delay from Clock to other Q outputs may be calculated with the following equations:

$$V_{CC} = 2.0 \text{ V: } t_p = [93.7 + 59.3 (n-1)] \text{ ns}$$

$$V_{CC} = 4.5 \text{ V: } t_p = [30.25 + 14.6 (n-1)] \text{ ns}$$

$$V_{CC} = 3.0 \text{ V: } t_p = [61.5 + 34.4 (n-1)] \text{ ns}$$

$$V_{CC} = 6.0 \text{ V: } t_p = [24.4 + 12 (n-1)] \text{ ns}$$
