

High Speed CMOS Logic – 74HC154

Dual 1-of-16 Decoder / Demultiplexer in bare die form

Rev 1.0
30/05/22

Description

The 74HC154 is fabricated using a 2.5µm 5V CMOS process and has the same high speed performance of LSTTL combined with CMOS low power consumption. The device consists of x4 active-high binary address inputs, x16 active-low outputs & x2 active-low chip-selects. The x2 active-low chip-selects can be used to strobe & eliminate normal decoding 'glitches' on the outputs, or can be used to expand the decoder. Both chip-selects must be low to enable the outputs. The demultiplexing function is executed by use of one chip-select input as multiplexed data input. When the other chip-select input is low, the addressed output will follow the state of the applied data.

Features:

- Output Drive Capability: 10 LSTTL Loads
- Low Input Current: 1µA
- Outputs directly interface CMOS, NMOS and TTL
- Operating Voltage Range: 2V to 6V
- CMOS High Noise Immunity
- Function compatible with 74LS154.

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. 2. Measured in plastic DIP package, results in die form are dependent on die attach and assembly method.

3. This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range $GND \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{CC}$. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

Pad Description

ADDRESS INPUTS

A0, A1, A2, A3

(Pads 23, 22, 21, 20)

These inputs, when the 1-of-16 decoder is enabled, determine which of its sixteen active-low outputs is selected.

CONTROL INPUTS

CS1, CS2

(Pads 18, 19)

Active-low chip-select inputs. With a low level on both inputs, the outputs of the decoder follow the Address inputs. A high level on either input forces all outputs to a high level.

OUTPUTS

Y0, Y1, Y2, Y3, Y4, Y5, Y6, Y7, Y8, Y9, Y10, Y11, Y12, Y13, Y14, Y15

(Pads 1-11, Pads 13-17)

Active-low outputs. These outputs assume a low level when addressed and both chip-select inputs are active. These outputs remain high when not addressed or when a chip-select input is high.
