Linear Voltage Regulator – 78L05

Positive Fixed 5V Voltage Regulator in bare die form

Rev 1.1

Description

The 78L05 is a 5V fixed 3-terminal voltage regulator delivering up to 100mA of output current and equipped with internal limiting + thermal shutdown features for overload immunity. Implementing this device at point-of-source removes the complexity of single point regulation methods with reduced noise. Used in replacement of a Zener diode/resistor combination, the device improves output impedance by x2 order of magnitude and delivers lower bias current with lower noise. The 78L05 can also be used with power-pass elements to make high-current voltage regulators.

Features:

- ±5% V_{OUT} tolerance over entire temperature range
- 100mA Output Current
- Internal thermal overload protection
- Internal short circuit current limit
- Full Military Temperature Range
- Negative Voltage complement is 79L05

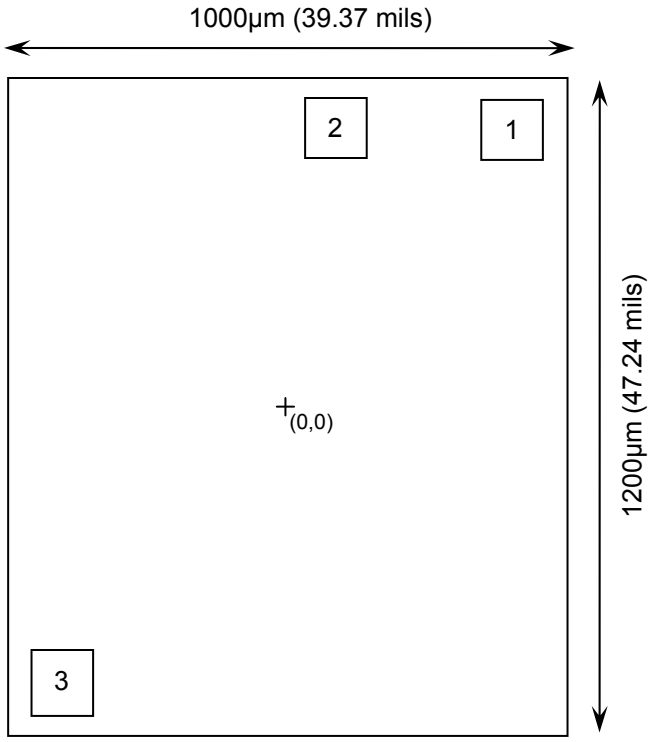
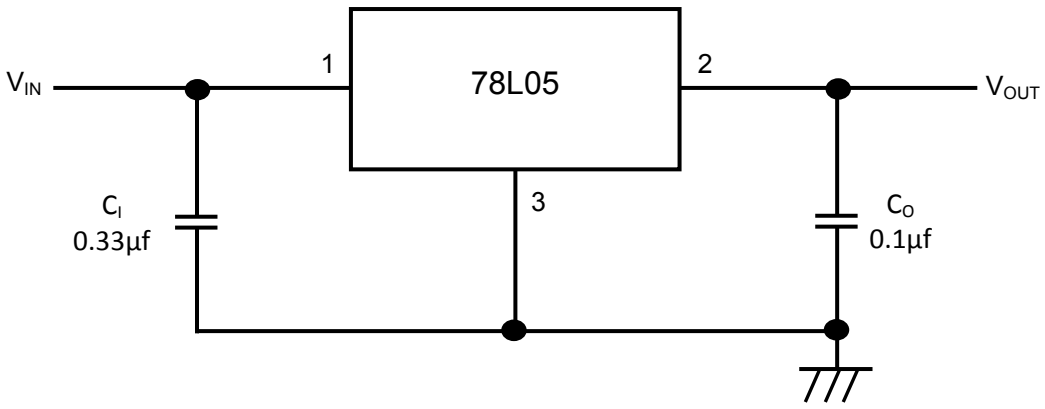
Pad Layout and Functions



PAD	FUNCTION	COORDINATES (µm)	
		X	Y
1	V_{IN}	312	407
2	V_{OUT}	30	410
3	GND	-412	-508
CONNECT CHIP BACK TO GND			

Typical Application



C_I is required if the regulator is located an appreciable distance from power supply filter. C_O is not required for stability; however it does improve transient response. For optimum stability and transient response locate C_I C_O as close as possible to the regulator.
