Description

The CD4081B Quad 2-Input AND Gate is fabricated using a 3µm 15CMOS process. The device has equal source and sink current capabilities and conforms to standard B series output drive. Device outputs are buffered which improves transfer characteristics by providing very high gain. The device is capable of driving x2 low power TTL loads or x1 LSTTL load.

Features:

- High Input Voltage up to 20V
- Symmetrical Output Characteristics
- Max input current 1µA at 18V over full Military Temperature Range
- Low Power TTL compatible
- Specified at 5V, 10V & 15V
- Direct drop-in replacement for obsolete components in long term programs.

Absolute Maximum Ratings¹

PARAMETER	SYMBOL	VALUE	UNIT
DC Supply Voltage (Referenced to V_{SS})	V_{DD}	-0.5 to +20	V
DC Input or Output Voltage (Referenced to V_{SS})	V_{IN}, V_{OUT}	-0.5 to $V_{DD}+0.5$	V
Storage Temperature Range	T_{STG}	-65 to 150	°C
Input Current or Output Current (per Pad)	I_{IN}, I_{OUT}	±10	mA
Power Dissipation in Still Air ²	P_D	750	mW

1. Operation above the absolute maximum rating may cause device failure. Operation at the absolute maximum ratings, for extended periods, may reduce device reliability. 2. Measured in plastic DIP package, results in die form are dependent on die attach and assembly method.

Recommended Operating Conditions³ (Voltages referenced to V_{SS})

PARAMETER	SYMBOL	MIN	MAX	UNITS
Supply Voltage	V_{DD}	3.0	18	V
DC Input Voltage, Output Voltage	V_{IN}, V_{OUT}	0	V_{DD}	V
Operating Temperature Range	T_J	-55	+125	°C

3. This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range $V_{SS} \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{DD}$. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}). Unused outputs must be left open.
